Q1. Write a function that multiplies two numbers. The function takes two pointers to integers as parameters and then stores the results in the third pointer to integer which is also a parameter of function. Also write the main function code which calls the multiply function and print the results.

```
include <iostream>
using namespace std;
void mult (int* a, int* b, int* c) {

    *c = (*a) * (*b);

}

int main () {
int a = 10;
int b = 20;
res p = 0;

mult ( &a, &b, &p );

cout << p;
cout

    return 0; }
```
